1 Exercise 1

No "final solutions" are provided for these types of questions, since the whole point of them is to encourage you to express *briefly* but *clearly* and *in your own words* what you understand. As explained in the directions, definitions taken from text books or the internet do not reflect a good understanding if these therms, nor do extremely long explanations. Equations do not express the meaning of these, nor do literal word translations of equations show that you know what they mean. Instead, we are looking for clear evidence that you understand what each term means. Possible definitions for each term is provided below:

(a) Direct elimination: A method to solve a system of equations that uses row operations to perform forward elimination in order to solve the system using backwards substitution.

(b) LU Factorization: Solving method that factors the initial matrix into lower and upper matrices in order to simplify the solving the system into forward and backwards substitutions.

(c) Inverse matrix: A matrix such that any square matrix multiplied by its inverse gives the identity matrix.

(d) Symmetric matrix: Any matrix that if you switch the rows and the columns you do not change the matrix.

(e) Transpose: A matrix operation that flips a matrix along its diagonal, i.e. switches its rows and columns.

(f) Permutation: Matrix operations that change the rows of an another matrix by multiplying it by a set of permutation matrices which are composed of the rows of the identity matrix.

(g) Inner product: A matrix operation that gives the projection of one matrix onto another.

(h) Singular matrix: A square matrix without an inverse.

2 Exercise 2

Solve the following system of equations, showing all relevant steps and stating the method used to solve the system (e.g., LU factorization, direct numerical solution, matrix elimination, etc.,). Furthermore, if a system has no solution state it has no solution and briefly describe why it has no solution.

(a) The following system of equations can be solved using the inverse matrix approach, namely

$$\mathbf{x} = \mathbf{A}^{-1}\mathbf{b} \tag{1a}$$

therefore we need to obtain A^{-1}. We can determine the inverse of matrix $\mathbf{A}$ using the augmented matrix method. Where the matrix $\mathbf{A}$ is augmented with the identity matrix

I, and row operations are performed until the left hand side of the augmented matrix is the identity matrix. Starting with the augmented matrix

$$\left[\begin{array}{ccc|ccc} 1 & 3 & 1 & 1 & 0 & 0 \\ 4 & 0 & 2 & 0 & 1 & 0 \\ 1 & 3 & 4 & 0 & 0 & 1 \end{array}\right] \tag{1b}$$

Then we can take $4r_1 - r_2$ to zero out the a_{21} term giving

$$\left[\begin{array}{ccc|ccc} 1 & 3 & 1 & 1 & 0 & 0 \\ 0 & 12 & 2 & 4 & -1 & 0 \\ 1 & 3 & 4 & 0 & 0 & 1 \end{array}\right] \tag{1c}$$

Next, the a_{31} is zeroed out by performing $r_1 - r_3$ giving

$$\left[\begin{array}{ccc|ccc} 1 & 3 & 1 & 1 & 0 & 0 \\ 0 & 12 & 2 & 4 & -1 & 0 \\ 0 & 0 & -3 & 1 & 0 & -1 \end{array}\right] \tag{1d}$$

Now we continue zeroing out entries of **A** moving up the matrix starting with a_{23} by performing $-\frac{2}{3}r_3 - r_2$ giving

$$\left[\begin{array}{ccc|ccc} 1 & 3 & 1 & 1 & 0 & 0 \\ 0 & -12 & 0 & -14/3 & 1 & 2/3 \\ 0 & 0 & -3 & 1 & 0 & -1 \end{array}\right] \tag{1e}$$

Moving up the third column we zero out a_{13} using $-1/3r_3 - r1$ giving

$$\left[\begin{array}{ccc|ccc} -1 & -3 & 0 & -1/3 & 0 & -1/3 \\ 0 & -12 & 0 & -14/3 & 1 & 2/3 \\ 0 & 0 & -3 & 1 & 0 & -1 \end{array}\right] \tag{1f}$$

Next we can zero a_{12} with $1/4r_2 - r_1$ giving

$$\left[\begin{array}{ccc|ccc} 1 & 0 & 0 & 1/6 & 1/4 & -1/6 \\ 0 & -12 & 0 & -14/3 & 1 & 2/3 \\ 0 & 0 & -3 & 1 & 0 & -1 \end{array}\right] \tag{1g}$$

Lastly we can multiply each trace entry by its reciprocal, i.e., $r_2 = -\frac{r_2}{12}$ and $r_3 = -\frac{r_3}{3}$, to finally get the inverse of matrix **A**,

$$\left[\begin{array}{ccc|ccc} 1 & 0 & 0 & 1/6 & 1/4 & -1/6 \\ 0 & 1 & 0 & 7/18 & -1/12 & -1/18 \\ 0 & 0 & 1 & -1/3 & 0 & 1/3 \end{array}\right] \tag{1h}$$

Thus

$$\boxed{\mathbf{x} = \mathbf{A}^{-1}\mathbf{b} = \begin{bmatrix} 1/6 & 1/4 & -1/6 \\ 7/18 & -1/12 & -1/18 \\ -1/3 & 0 & 1/3 \end{bmatrix} \begin{bmatrix} 5 \\ 6 \\ 3 \end{bmatrix} = \begin{bmatrix} 23/18 \\ 44/24 \\ -2/3 \end{bmatrix}} \tag{1i}$$

(b) From the system of equations

$$\begin{bmatrix} 1 & 4 & 2 \\ 2 & 8 & 4 \\ 1 & 5 & 4 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} \begin{bmatrix} 1 \\ 2 \\ 1 \end{bmatrix} \tag{2}$$

it is obvious that the second row is a linear combination of the first row, i.e. $r_2 = 2r_1$. Therefore the second equation in the system adds no new information, that we do not already have from the first row. Thus we have a system with three unknowns, x, y, z, and only two equations and cannot obtain an unique solution.

(c) The simplest way to solve the following system

$$\begin{bmatrix} 1 & 3 & 1 \\ 4 & 1 & 2 \\ 0 & 0 & 4 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 1 \\ 2 \\ 1 \end{bmatrix} \tag{3a}$$

is to use to use the first row to cancel out the first entry of the second row, i.e. $4r_1 - r_2$, giving

$$\begin{bmatrix} 1 & 3 & 1 \\ 0 & 11 & 2 \\ 0 & 0 & 4 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 1 \\ 2 \\ 1 \end{bmatrix} \tag{3b}$$

and them backwards substituting. Thus

$$\boxed{\begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 15/44 \\ 3/22 \\ 1/4 \end{bmatrix}} \tag{3c}$$

(d) The easiest way to solve this system of equations

$$\begin{bmatrix} 0 & 1 & 2 & 0 & 0 \\ 5 & 0 & 2 & 0 & 0 \\ 0 & 0 & 0 & 1 & 1 \\ 0 & 0 & 0 & 0 & 1 \\ 0 & 0 & 1 & 0 & 3 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \\ x_4 \\ x_5 \end{bmatrix} \begin{bmatrix} 1 \\ 2 \\ 3 \\ 4 \\ 5 \end{bmatrix} \tag{4a}$$

is to swap the rows so that all the pivots are non-zero giving

$$\begin{bmatrix} 5 & 0 & 2 & 0 & 0 \\ 0 & 1 & 2 & 0 & 0 \\ 0 & 0 & 1 & 0 & 3 \\ 0 & 0 & 0 & 1 & 1 \\ 0 & 0 & 0 & 0 & 1 \end{bmatrix} = \begin{bmatrix} x_1 \\ x_2 \\ x_3 \\ x_4 \\ x_5 \end{bmatrix} = \begin{bmatrix} 2 \\ 1 \\ 5 \\ 3 \\ 4 \end{bmatrix} \tag{4b}$$

Now the system of equations can be solved quite easily using backwards substitution. Thus

$$\boxed{\begin{bmatrix} x_1 \\ x_2 \\ x_3 \\ x_4 \\ x_5 \end{bmatrix} = \begin{bmatrix} 16/5 \\ 15 \\ -7 \\ -1 \\ 4 \end{bmatrix}} \tag{5}$$

3 Exercise 3

The following system of equations

$$2x + 3y = 4 \tag{6a}$$

$$x + 2y = 5 \tag{6b}$$

can easily be solve by hand. First solve for x in terms of y in Eq. (6b),

$$x = 5 - 2y \tag{6c}$$

Next substitute x into Eq. (6a) to obtain a value for y, namely

$$2(-5 - 2y) + 3y = 4 \rightarrow y = 6 \tag{6d}$$

Thus

$$\boxed{x = -7} \tag{6e}$$

$$\boxed{y = 6} \tag{6f}$$

Furthermore, the solution can be verified by solving for y in both equations and plotting both curves and observing their intersection point, as shown in Fig (1).

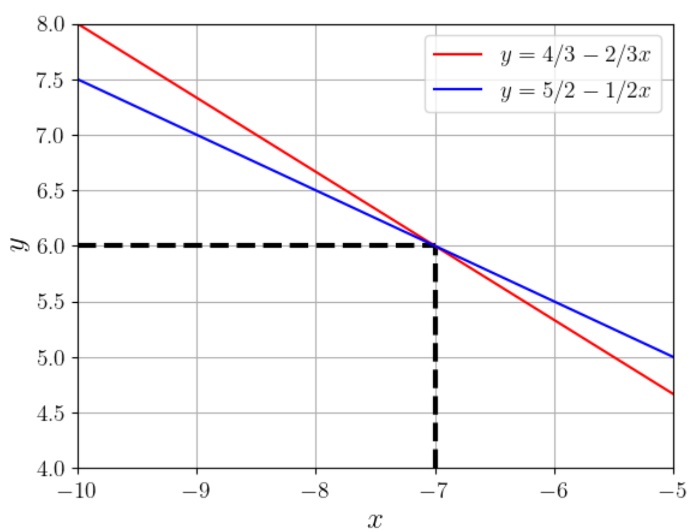

Figure 1: Verification plot for Exercise 3

Please see the Appendix for the full version of the verification code.

4 Exercise 4

Prove the following matrix properties:

(a) Prove the following:

$$(AB)^T = B^T A^T \tag{7a}$$

Start be defining two $N \times N$ matrices $\mathbf{A}$ and $\mathbf{B}$,

$$\mathbf{A} = A_{ij} = \begin{bmatrix} a_{1,1} & a_{1,2} & \cdots & a_{1,n} \\ a_{2,1} & a_{2,2} & \cdots & a_{2,n} \\ \vdots & \vdots & \ddots & \vdots \\ a_{n,1} & a_{n_2} & \cdots & a_{n,n} \end{bmatrix} \tag{7b}$$

$$\mathbf{B} = B_{ij} = \begin{bmatrix} b_{1,1} & b_{1,2} & \cdots & b_{1,n} \\ b_{2,1} & b_{2,2} & \cdots & b_{2,n} \\ \vdots & \vdots & \ddots & \vdots \\ b_{n,1} & b_{n,2} & \cdots & b_{n,n} \end{bmatrix} \tag{7c}$$

which gives the following for the LHS of Eq. (7a)

$$AB = \underbrace{\sum_{k=1}^{N} A_{ik} B_{kj}}_{\equiv C_{ij}} = \begin{bmatrix} a_{1,1}b_{1,1} + a_{1,2}b_{2,1} & a_{1,1}b_{1,2} + a_{1,2}b_{2,2} & \cdots \\ a_{2,1}b_{1,1} + a_{2,2}b_{2,1} & a_{2,1}b_{1,2} + a_{2,2}b_{2,2} & \cdots \\ \vdots & \ddots & \vdots \end{bmatrix} \tag{7d}$$

Therefore,

$$C^T = \begin{bmatrix} a_{1,1}b_{1,1} + a_{1,2}b_{2,1} & a_{2,1}b_{1,1} + a_{2,2}b_{2,1} & \cdots \\ a_{1,1}b_{1,2} + a_{1,2}b_{2,2} & a_{2,1}b_{1,2} + a_{2,2}b_{2,2} & \cdots \\ \vdots & \ddots & \vdots \end{bmatrix} \tag{7e}$$

Next we can look at the RHS of Eq. (7a) where,

$$A^T = \begin{bmatrix} a_{1,1} & a_{2,1} & \cdots & a_{n,1} \\ a_{1,2} & a_{2,2} & \cdots & a_{n,2} \\ \vdots & \vdots & \ddots & \vdots \\ a_{1,n} & a_{2,n} & \cdots & a_{n,n} \end{bmatrix} \tag{7f}$$

$$B^T = \begin{bmatrix} b_{1,1} & b_{2,1} & \cdots & b_{n,1} \\ b_{1,2} & b_{2,2} & \cdots & b_{n,2} \\ \vdots & \vdots & \ddots & \vdots \\ b_{1,n} & b_{2,n} & \cdots & b_{n,n} \end{bmatrix} \tag{7g}$$

Therefore,

$$B^T A^T = \begin{bmatrix} b_{1,1}a_{1,1} + b_{2,1}a_{1,2} & b_{1,1}a_{2,1} + b_{2,1}a_{2,2} & \cdots \\ b_{1,2}a_{1,1} + b_{2,2}a_{1,2} & b_{1,2}a_{2,1} + b_{2,2}a_{2,2} & \cdots \\ \vdots & \ddots & \vdots \end{bmatrix} \tag{7h}$$

which is equivalent to Eq. (7e).

(b) To prove the following

$$\left(A^{-1}\right)^T = \left(A^T\right)^{-1} \tag{8a}$$

start with

$$A^{-1}A = I \tag{8b}$$

where from part(a) we know that

$$\left(A^{-1}A\right)^T = A^T\left(A^{-1}\right)^T = I^T \tag{8c}$$

and since

$$I^T = I \tag{8d}$$

then

$$A^{-1}A = A^T\left(A^{-1}\right)^T = I \tag{8e}$$

Thus

$$\boxed{\left(A^{-1}\right)^T = \left(A^T\right)^{-1}} \tag{8f}$$

(c) Lets consider the following symmetric matrix

$$C = \begin{bmatrix} c_{1,1} & c_{1,2} & c_{1,3} & \cdots & c_{1,n} \\ c_{1,2} & c_{2,2} & c_{2,3} & \cdots & c_{2,n} \\ c_{1,3} & c_{2,3} & c_{3,3} & \cdots & c_{3,n} \\ \vdots & \vdots & \ddots & \vdots & \vdots \\ c_{1,n} & c_{2,n} & c_{3,n} & \cdots & c_{n,n} \end{bmatrix} \tag{9a}$$

where for in index notation $C_{ij} = C_{ji}$. Therefore,

$$\boxed{C^T = \begin{bmatrix} c_{1,1} & c_{1,2} & c_{1,3} & \cdots & c_{1,n} \\ c_{1,2} & c_{2,2} & c_{2,3} & \cdots & c_{2,n} \\ c_{1,3} & c_{2,3} & c_{3,3} & \cdots & c_{3,n} \\ \vdots & \vdots & \ddots & \vdots & \vdots \\ c_{1,n} & c_{2,n} & c_{3,n} & \cdots & c_{n,n} \end{bmatrix} = C} \tag{9b}$$

5 Exercise 5

(a)

$$A = \begin{bmatrix} 1 & 3 & 2 \\ 3 & 5 & 4 \\ 2 & 4 & 6 \end{bmatrix} \tag{10a}$$

As covered in lecture we know that A can be factored into a product of lower and upper matrices, namely

$$A = LU = \begin{bmatrix} 1 & 0 & 0 \\ l_{2,1} & 1 & 0 \\ l_{3,1} & l_{3,2} & 1 \end{bmatrix} \begin{bmatrix} u_{1,2} & u_{1,2} & u_{1,2} \\ 0 & u_{2,2} & u_{2,2} \\ 0 & 0 & u_{3,2} \end{bmatrix} \tag{10b}$$

where the non-zero off diagonal entries of L are the multipliers used in forward elimination, and the entries of U are the values after all the row operations are performed. Therefore, the easiest way to perform LU decomposition is to set $U = A$ and perform forward elimination. Starting with the first row, since $r_2 - 3r_1$ zeros out $a_{2,1}$, we know that $l_{2,1} = 3$, and that the updated U matrix is

$$U = \begin{bmatrix} 1 & 3 & 2 \\ 0 & -4 & -2 \\ 2 & 4 & 6 \end{bmatrix} \tag{10c}$$

To cancel out the third row we need $r_3 - 2r_1$, therefore $l_{31} = 2$ and the updated U is

$$U = \begin{bmatrix} 1 & 3 & 2 \\ 0 & -4 & -2 \\ 0 & -2 & 2 \end{bmatrix} \tag{10d}$$

Lastly, $r_3 - \frac{1}{2}r_2$ would zero out the last entry, therefore $l_{32} = 1/2$, and

$$U = \begin{bmatrix} 1 & 3 & 2 \\ 0 & -4 & -2 \\ 0 & 0 & 3 \end{bmatrix} \tag{10e}$$

Thus

$$\boxed{A = LU = \begin{bmatrix} 1 & 0 & 0 \\ 3 & 1 & 0 \\ 2 & 1/2 & 1 \end{bmatrix} \begin{bmatrix} 1 & 3 & 2 \\ 0 & -4 & -2 \\ 0 & 0 & 3 \end{bmatrix}} \tag{10f}$$

Furthermore, we can obtain the $A = LDU$ factorization, by dividing U by a diagonal matrix D that contains the pivots, namely

$$\boxed{A = LDU = \begin{bmatrix} 1 & 0 & 0 \\ 3 & 1 & 0 \\ 2 & 1/2 & 1 \end{bmatrix} \begin{bmatrix} 1 & 0 & 0 \\ 0 & -4 & 0 \\ 0 & 0 & 3 \end{bmatrix} \begin{bmatrix} 1 & 3 & 2 \\ 0 & 1 & -2 \\ 0 & 0 & 1 \end{bmatrix}} \tag{10g}$$

(b)

$$B = \begin{bmatrix} 1 & 0 & 1 \\ 2 & 2 & 2 \\ 3 & 4 & 5 \end{bmatrix} \tag{11a}$$

Using the same methodology as part(a), we use $r_2 - 2r_1$ which gives $l_{21} = 2$ and

$$U = \begin{bmatrix} 1 & 0 & 1 \\ 0 & 2 & 0 \\ 3 & 4 & 5 \end{bmatrix} \tag{11b}$$

Next, we need $r_3 - 3r_1$, therefore $l_{31} = 3$ and

$$U = \begin{bmatrix} 1 & 0 & 1 \\ 0 & 2 & 0 \\ 0 & 4 & -1 \end{bmatrix} \tag{11c}$$

Lastly, we need $r_3 - 2r_2$ giving $l_{32} = 2$ and

$$U = \begin{bmatrix} 1 & 0 & 1 \\ 0 & 2 & 0 \\ 0 & 0 & -1 \end{bmatrix} \tag{11d}$$

Thus

$$\boxed{B = LU = \begin{bmatrix} 1 & 0 & 0 \\ 2 & 1 & 0 \\ 3 & 2 & 1 \end{bmatrix} \begin{bmatrix} 1 & 0 & 1 \\ 0 & 2 & 0 \\ 0 & 0 & -1 \end{bmatrix}} \tag{11e}$$

and

$$\boxed{B = LDU = \begin{bmatrix} 1 & 0 & 0 \\ 2 & 1 & 0 \\ 3 & 2 & 1 \end{bmatrix} \begin{bmatrix} 1 & 0 & 0 \\ 0 & 2 & 0 \\ 0 & 0 & -1 \end{bmatrix} \begin{bmatrix} 1 & 0 & 1 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}} \tag{11f}$$

(c)

$$\begin{bmatrix} 2 & 1 & 3 \\ 3 & 2 & 3 \\ 3 & 1 & 0 \end{bmatrix} \tag{12a}$$

First, since there is a zero pivot in the third row we know were going to need a permutation matrix. A good chose for this problem would be to make the following row switches,

$$r_1 \to r_3 \tag{12b}$$

$$r_2 \to r_1 \tag{12c}$$

$$r_1 \to r_3 \tag{12d}$$

Therefore we get

$$PA = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 1 & 0 & 0 \end{bmatrix} \begin{bmatrix} 2 & 1 & 3 \\ 3 & 2 & 3 \\ 3 & 1 & 0 \end{bmatrix} = \begin{bmatrix} 3 & 2 & 3 \\ 3 & 1 & 0 \\ 2 & 1 & 3 \end{bmatrix} \tag{12e}$$

Now we can apply the same methodology as above, starting with $r_2 - r_1$, therefore $l_{2,1} = 1$ and

$$U = \begin{bmatrix} 3 & 2 & 3 \\ 0 & -1 & -3 \\ 2 & 1 & 3 \end{bmatrix} \tag{12f}$$

Next, $r_3 - 2/3r_1$, therefore $l_{3,1} = \frac{2}{3}$ and

$$U = \begin{bmatrix} 3 & 2 & 3 \\ 0 & -1 & -3 \\ 0 & -1/3 & 1 \end{bmatrix} \tag{12g}$$

Lastly, $r_3 - \frac{1}{3}r_3$, therefore $l_{3,2} = \frac{1}{3}$ and

$$U = \begin{bmatrix} 3 & 2 & 3 \\ 0 & -1 & -3 \\ 0 & 0 & -2 \end{bmatrix} \tag{12h}$$

Thus

$$\boxed{PA = LU = \begin{bmatrix} 1 & 0 & 0 \\ 1 & 1 & 0 \\ 2/3 & 1/3 & 1 \end{bmatrix} \begin{bmatrix} 3 & 2 & 3 \\ 0 & -1 & -3 \\ 0 & 0 & -2 \end{bmatrix}} \tag{12i}$$

and

$$\boxed{PA = LDU = \begin{bmatrix} 1 & 0 & 0 \\ 1 & 1 & 0 \\ 2/3 & 1/3 & 1 \end{bmatrix} \begin{bmatrix} 3 & 0 & 0 \\ 0 & -1 & 0 \\ 0 & 0 & -2 \end{bmatrix} \begin{bmatrix} 1 & 2 & 3 \\ 0 & 1 & -3 \\ 0 & 0 & 1 \end{bmatrix}} \tag{12j}$$

6 Exercise 6

The following algorithm was used to perform the LU factorization

Algorithm 1: LU Factorization

Result: Factoring matrix A into L and U
Input : A
Output: L, U

$L = I(3)$
$U = A$

for *k in range(0, M-1)* **do**
    for *j in range(k+1, M)* **do**
        L[J,K] = U[J,K]/U[K,K]
        U[J,K:] = U[J,K:]-L[J,K]*U[K,K:]
        U[J,K] = 0.0
    end
end

Secondly, we can plot the number of points versus computational time, as seen in Fig .(2), where we see how important it is to use built in Python packages.
